Business Thesis: **University STEM & Engineering Departments** will purchase **Apple Vision Spatial Canvas for STEM** because it **transforms abstract, 3D multi-variable concepts into real-time interactive spatial models, accelerating student comprehension while reducing physical lab equipment cost**

Product Architecture

Volumetric Vector Rendering: Real-time 3D simulation of Maxwell's equations, fluid dynamics, and stress tensors directly in room space.

Precision Multimodal Control: Low-latency gaze tracking and hand gesture pinching for real-time mathematical parameter tuning.

Multi-User Collaborative Workspace

Co-located Lab Sessions: Shared spatial anchors allow instructors and students to interact with identical 3D models simultaneously.

Tooling Integrations: Direct API pipelines for MATLAB, Python (NumPy/SciPy), and CAD format import/export.

Product Impact

Lab Cost Reduction: Replaces expensive physical test benches, wind tunnels, and wave tanks with software-defined digital twins sold via enterprise university seat licensing.
